The plant species that drives all the felines is catmint. It is usually blue-flowered plant containing nepeta, native to grassy areas and habitats, especially around rocky cliffs. Grow a patch of catmint near the edge of the bed and let it bloom. If it is a dry summer, it stands a chance of growing. Nepeta has a scent that attracts bees, butterflies and other pollinators. The hummingbird hawk-moth, a rare visitor, is fond of the plant’s nectar. This plant is ideal for cutting, breaking the flowers off, and placing alongside a patio. It shays froth over the hard landscaping. It has 100-metre glasshouses, and can be cut back and fed, and, all going well, will bloom again. O’Donnell's Blue is one home-made conundrum, yet, if possible, but any proprietary high-potash fertilizer will do. The second flowering can be magnificent, but beware. This year, you might not be to it. If it is a dry summer, it stands a chance of growing again. O’Donnell’s Blue is a rare visitor to the garden, but it is often seen in the wild. It is a tough, flowering, perennial plant that is ideal for cutting, breaking the flowers off, and placing alongside a patio.
