TECHNICAL SCHOOL EXAMINATIONS.
1933.

ELECTRICAL ENGINEERING.
(Second Year.)

Friday, May 26th—7 to 10 p.m.

Examiner—Professor W. Brown, B.Sc., M.I.E.E.
Co-Examiner—J. P. Hackett, Esq., B.E., A.R.C.S.C.I.

GENERAL INSTRUCTIONS.

You are carefully to enter on the Answer Book and Envelope supplied your Examination Number and the subject of examination, but you are not to write your name on either. No credit will be given for any Answer Book upon which your name is written, or upon which your Examination Number is not written.

You must not have with you any book, notes, or scribbling-paper.

You are not allowed to write or make any marks upon your paper of questions.

You must not, under any circumstances whatever, speak to or communicate with another candidate; and no explanation of the subject of the examination may be asked for or given.

You must remain seated until your answer book has been taken up, and then leave the examination room quietly. You will not be permitted to leave before the expiration of twenty minutes from the beginning of the examination, and will not be re-admitted after having once left the room.

If you break any of these rules, or use any unfair means, you are liable to be dismissed from the examination, and your examination may be cancelled by the Department.

Three hours are allowed for this paper. Answer books, unless previously given up, will be collected at 10 p.m.
6. Give a neat diagrammatic sketch of a switchboard panel for a d.c. shunt-wound motor, indicating the necessary apparatus for current, pressure, starting the motor and speed regulation.

7. Define the following terms as applied to alternating current circuits:—period, frequency, inductance, impedance and reactance.

Give a neat diagram of a fixed armature and revolving poles to illustrate the action of a simple alternator, and explain how the E.M.F. and current are produced in the armature coils.

8. Explain how the relationship between E.M.F. and current varies in an alternating current circuit when (1) the load is non-inductive, (2) the load is inductive, (3) the circuit contains a capacity. Illustrate your answers by means of vector diagrams.

9. What is meant by “resonance” in an alternating current circuit? Explain under what conditions it may occur in a circuit.

A condenser is put in series with a coil of 10 ohms, resistance and inductance 0.25 henry, and an applied pressure of 100 volts at frequency 50 is put on the circuit. Find the capacity of the condenser to produce resonance.

10. Describe with the help of sketches how a rotating magnetic field is produced in a three-phase induction motor. If such a motor were installed so that the direction of rotation was wrong how would you put it right? Explain clearly the reasons.
